Smoke Test Brief — BUG-2026-10-06-001

MyGenie Customer App · Fix: "QR rule log now shows what it let through" · QA status: PASS 11/11 (2026-10-07) · Tester: _____ · Date: _____

What this is about

Some restaurants have a setting called **"Allow orders without QR"**. When it is switched **off**, a diner who opens the restaurant by typing the web address (instead of scanning the table QR) is stopped with a *"Session Expired — please rescan"* message.

What was wrong

Until now the app only wrote a log entry when it **stopped** someone. It wrote **nothing** when it **let someone through** — for example a diner who scanned the walk-in QR, a takeaway or delivery order, someone editing an existing order, or restaurant 716 (which is deliberately exempt). So a restaurant looking at the log saw only "blocked" entries and had no way to tell whether the rule was being applied to everyone else or quietly bypassed.

What the fix does

The app now writes a log entry for **every** decision — both "blocked" and "allowed" — together with the reason (e.g. *valid QR*, *takeaway*, *716 exemption*). This happens only at restaurants that have the setting switched **off**. Restaurants with the setting on (the default) are unaffected and still log nothing.

> **What must NOT have changed:** nobody should be blocked who wasn't blocked before, and nobody should get through who didn't before. If you see any difference in *who can order*, that is a FAIL — stop and report it.

Before you start

You need	Notes
A test restaurant	One where you can toggle **"Allow orders without QR"** in the admin settings
Its **walk-in QR** code or walk-in link	Ask the agent if you don't have it
A phone (or browser)	Clear the tab / use a fresh private window between steps
The agent on chat	You will ask it to read the log rows for you

The test — 3 steps (about 10 minutes)

Step 1 — Rule OFF, legitimate diner

1. In admin, switch **"Allow orders without QR"** → **OFF** for the test restaurant.
2. On your phone, scan the **walk-in QR** (or open the walk-in link). Log in if prompted.
3. Tap **Browse Menu** → add any item → go to **Review Order** → place the order (or stop at the payment screen if you don't want a real order).
4. **Expected:** everything works exactly as it always has — no blocking message.
5. Ask the agent: *"show me the new rows for restaurant ___"*. **Expected: 3 entries** (landing · add to cart · place order), each `valid-qr` **/ allowed**.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Rule OFF, diner without QR

1. Keep the setting OFF. Close the tab / open a fresh private window.
2. Type the restaurant's web address directly — no QR, nothing after the address.
3. Tap **Browse Menu**.
4. **Expected:** the *"Session Expired — please rescan"* message appears and you cannot continue.
5. Ask the agent for the new row. **Expected: 1 entry**, `non-qr-dinein` **/ blocked**.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Rule ON (normal state)

1. In admin, switch **"Allow orders without QR"** → **ON** again.
2. Repeat Step 1 (walk-in QR → browse → add → review).
3. **Expected:** works as normal **and** when you ask the agent for new rows there are **none**.

Result: □ PASS □ FAIL — notes: _____

Optional extra (2 minutes)

Do Step 1 while **logged in** as a customer and ask the agent to confirm the "add to cart" row shows *logged in = yes*.

Result: □ PASS □ FAIL □ skipped

Reporting

- All three steps match → reply **"Smoke PASS BUG-2026-10-06-001"**.
- Anything different → reply **"Smoke FAIL BUG-2026-10-06-001 — step N"** with what you saw and a screenshot. Do not try to work around it.

Overall: □ PASS □ FAIL Signed: _____ Date: _____

Smoke Test Brief — CR-2026-10-03-003

MyGenie Customer App · Change: "Diner feedback now goes to CRM" · QA status: PASS 11/11 (2026-10-07) · Tester: _____ · Date: _____

What this is about

Diners can leave **Feedback** (stars + a message) from the restaurant's menu in the app. That feedback is meant to show up in the **CRM** so the restaurant can read it.

What was wrong

The app sent feedback to **our own server**, which wrote it straight into the CRM's database in a format the CRM couldn't read. Nobody ever saw it — but the diner still got a "Thank you!" message. Feedback was going into a black hole.

What the change does

- The app now sends feedback **directly to the CRM** using the diner's sign-in, so it appears in the CRM properly, linked to the right customer.
- The **Name** and **Email** boxes are gone — the CRM already knows who the diner is.
- Diners who are **not signed in** see a message asking them to sign in (from the home page, by entering their phone number). They cannot submit until they do. *(A later change will let guests leave feedback with just a phone number, once the CRM supports it.)*
- If the CRM is unavailable, the diner sees an honest "Failed to submit, please try again" — never a false "Thank you".

> **What must NOT have changed:** the rest of the app — home page, menu, cart, ordering — behaves exactly as before. The Feedback entry still appears/disappears according to the restaurant's "Feedback" setting in admin.

Before you start

You need	Notes
Test restaurant **478** (Feedback is enabled there)	Ask the agent if you'd like a different one
A phone number the CRM knows — the usual test number works	Entering it on the home page signs you in
A phone or browser, plus a **private/incognito window**	For the "not signed in" step
Someone with CRM access (or the agent)	To confirm the feedback arrived

The test — 3 steps (about 10 minutes)

Step 1 — Signed-in diner leaves feedback

1. Open the restaurant's home page, enter your phone number (and name if asked), tap **Browse Menu**. If a password page appears, complete it or use the "skip" path.
2. Open the menu (☰) and tap **Feedback**.
3. **Expected:** you see **stars** and a **message box** only — **no Name or Email boxes**.
4. Pick 4 stars, type "Smoke test CR-003", tap **Submit Feedback**.
5. **Expected:** green tick **"Thank You!"** screen.
6. Ask CRM (or the agent) to confirm the feedback for your phone number is there, with rating 4 and your message.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Not signed in

1. Open a **private/incognito window** (so you are not signed in).
2. Go directly to `⋯/478/feedback`.
3. **Expected:** no form. A message — *"Feedback is available to signed-in diners. Sign in from the home page by entering your phone number."* — and a **Sign in** button.
4. Tap **Sign in**. **Expected:** you land on the restaurant's **home page**.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Nothing else moved

1. Back in your signed-in window: open the menu, add an item to the cart, open Review Order. **Expected:** all as usual.
2. Ask the agent: *"Did our server store any feedback today?"* **Expected answer:** "No — our server no longer stores feedback; it all went to CRM."

Result: □ PASS □ FAIL — notes: _____

Optional extra (2 minutes)

In admin, switch **Feedback** off for restaurant 478 and reload the home page. **Expected:** the Feedback entry disappears from the menu. Switch it back on afterwards.

Result: □ PASS □ FAIL □ skipped

Reporting

- All steps match → reply **"Smoke PASS CR-2026-10-03-003"**.
- Anything different → reply **"Smoke FAIL CR-2026-10-03-003 — step N"** with what you saw and a screenshot. Do not try to work around it.

Smoke Test Brief — CR-2026-10-08-001 Step 1

MyGenie Customer App · Change: "Password page removed — everyone goes straight to the menu" · QA status: PASS 9/10 (2026-10-08) · Tester: _____ · Date: _____

What this is about

When a diner opens the app and taps **Browse Menu**, they were sometimes sent to a **password page** before they could see the menu. This depended on a per-restaurant setting called "Skip OTP". Most restaurants had it switched off — meaning almost every diner hit the password page.

What was wrong

The password page let diners register or log in with a password. The CRM (our identity provider) has now **removed that feature entirely** — the register and login routes no longer exist. Any diner routed to the password page would be completely stuck, with no way to get to the menu.

What the change does

- Every diner now goes straight through **sign-in silently** (called "skip-otp") when they tap Browse Menu — no password page, no extra step. The per-restaurant "Skip OTP" settings are ignored. This was already the path for restaurants that had the setting switched on; it is now the path for everyone.
- The password page URL (`/password-setup`) now **redirects** to the restaurant's home page, so old bookmarks or back-button navigations land safely.
- If sign-in returns a rare error (the diner's account needs special handling), the diner continues as a **guest** and can still browse and order — they are never blocked.
- If too many sign-in attempts are made in a short time, the app shows a clear **"Please try again in X seconds"** message instead of silently failing.

> **What must NOT have changed:** the menu, cart, ordering, payment, feedback — everything else — behaves exactly as before. Diners should notice no difference except that the password screen no longer appears.

Before you start

You need	Notes
Restaurant **478**	This restaurant had the Skip OTP setting switched **off** — it is the exact case this change fixes
Test phone number **9579504871**	Or any phone the CRM knows for restaurant 478
A phone or browser	Use a fresh private/incognito window for steps that require a "not signed in" state

The test — 3 steps (about 10 minutes)

Step 1 — Phone + Browse Menu goes straight to the menu

1. Open a **private/incognito window** and go to the restaurant's home page (restaurant 478).
2. Enter phone number **9579504871** (and a name if asked). Tap **Browse Menu**.
3. **Expected:** you land on the **menu page** directly. The password / OTP page does **not** appear at any point.
4. Check the browser address bar — it should end with `/menu` or `/stations`, **not** `/password-setup`.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Old password page URL redirects safely

1. In the same or a new window, manually type (or paste) the restaurant's password page address: `⋯/478/password-setup`
2. **Expected:** you are **redirected** to the restaurant's home page (`/478`). You never see a password form.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Ordering still works end to end

1. From the home page (restaurant 478), enter the test phone and tap **Browse Menu**.
2. Add any item to the cart.
3. Tap **Review Order** → confirm the cart is correct.
4. **Expected:** the full flow works exactly as usual. No errors, no password prompts anywhere.

Result: □ PASS □ FAIL — notes: _____

Optional extra (2 minutes)

On a restaurant that previously had "Skip OTP" switched **on** (e.g. restaurant 689), enter a phone and tap Browse Menu. **Expected:** behaves identically to Step 1 — no password page, lands on menu. The change should make no visible difference here since it was already working.

Result: □ PASS □ FAIL □ skipped

Reporting

- All steps match → reply **"Smoke PASS CR-2026-10-08-001"**.
- Anything different → reply **"Smoke FAIL CR-2026-10-08-001 — step N"** with what you saw and a screenshot. Do not try to work around it.

Overall: □ PASS □ FAIL Signed: _____ Date: _____

Smoke Test Brief — CR-2026-09-15-001

MyGenie Customer App · Change: "Profile Orders, Points and Wallet tabs now load correctly" · QA status: PASS 7/8 (2026-10-08) · Tester: _____ · Date: _____

What this is about

The **Profile page** (tap ☰ → Profile after signing in) has four tabs — Profile, Orders, Points, and Wallet. The last three were completely broken for every diner: tapping **Orders**, **Points**, or **Wallet** showed a "Failed to load" error and an empty list instead of real data.

The cause was simple: the app was requesting data from old CRM addresses (API routes) that no longer exist. The CRM had moved to new addresses, and the app had not been updated to match.

What the fix covers

1. Orders tab now works Fetches from the correct CRM route. Order type codes are mapped to readable labels — "Dine-in" instead of the raw `dinein`, "Takeaway" instead of `takeaway`, and so on.

2. Points tab now works Fetches from the correct CRM route. A sign bug was also fixed: "Bonus reward" transactions (e.g. a first-visit welcome bonus) were incorrectly showing a `−` (negative) sign. They now correctly show `+`.

3. Wallet tab now works Fetches from the correct CRM route. The tab now also only appears when the restaurant has the Wallet feature switched **on** in admin settings — it was always visible before, even when the feature was off.

4. "Showing N of M orders" count If a diner has more than 50 orders on record, a small line tells them the list is not complete — e.g. "Showing 50 of 120 orders".

The header card (name, tier badge, total points, wallet balance summary) was already working and is completely unchanged.

> **What must NOT have changed:** signing in, browsing the menu, placing an order, feedback — everything outside the Profile page behaves exactly as before.

Before you start

You need	Notes
A signed-in diner session	Enter your phone on the restaurant's home page and tap Browse Menu to sign in first
Restaurant **689** (Kunafa Mahal)	Or any restaurant you have access to
The hamburger menu (☰)	Top-right corner of the landing page — tap it to find Profile

The test — 3 steps (about 10 minutes)

Step 1 — Orders tab loads correctly

1. Sign in at the restaurant's home page (enter your phone, tap Browse Menu).
2. Tap ☰ → **Profile** (or navigate to `/profile`).
3. Tap the **Orders** tab.
4. **Expected:** your order history appears — date, amount, order type (e.g. "Dine-in"), points earned. **No "Failed to load" error toast.**
5. If you have no previous orders: **Expected:** "No orders yet" message — **no error toast**.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Points tab signs are correct

1. Tap the **Points** tab.
2. **Expected:** your points history appears — transactions listed with `+` or `−` signs.
3. Check specifically: any **"First visit bonus"** or **"Bonus reward"** entry must show a `+` sign (not `−`). Expired or redeemed entries show `−`.
4. **No "Failed to load" error toast.**

Result: □ PASS □ FAIL — notes: _____

Step 3 — Wallet tab and nothing else broke

1. Look at the tab bar at the top of the Profile page.
2. **Expected for restaurant 689: no Wallet tab button** (Wallet is off by default).
3. Back on the home page: add an item to the cart and open Review Order. **Expected:** all as usual, no errors.

Result: □ PASS □ FAIL — notes: _____

Optional extra (2 minutes)

In admin settings for any restaurant, switch **Wallet** on. Reload the Profile page for that restaurant. **Expected:** a Wallet tab now appears. Switch it back off afterwards.

Result: □ PASS □ FAIL □ skipped

Reporting

- All steps match → reply **"Smoke PASS CR-2026-09-15-001"**.
- Anything different → reply **"Smoke FAIL CR-2026-09-15-001 — step N"** with what you saw and a screenshot. Do not try to work around it.

Overall: □ PASS □ FAIL Signed: _____ Date: _____

Smoke Test Brief — CR-2026-10-03-004 (Parts A + B + C)

MyGenie Customer App · Change: "CRM database back-door reads replaced with CRM API calls" · QA status: PASS — all parts · Tester: _____ · Date: _____

What this is about

Your app and CRM share a database. The app was reading some of CRM's data tables directly — bypassing CRM's official API. This CR closes that back door across three steps, each of which is tested below.

> **What must NOT have changed:** name auto-fill on the landing page, the Browse Menu flow, the checkout loyalty earn preview (numbers will be different — see Step 4), order placement, feedback — all core flows work identically to before.

Before you start

You need	Notes
Restaurant **689**	Loyalty is live here; used for Parts B and C
Restaurant **478**	Phone capture is enabled here; used for Part A
A test phone **9579504871**	Known customer on both restaurants
A browser in a fresh tab	

Part A — Landing page name auto-fill (2 steps, ~3 minutes)

What changed: the name lookup now calls CRM's API instead of your backend reading CRM's database directly. The diner sees no difference.

Step 1 — Known phone auto-fills name

1. Open the restaurant **478** home page.
2. Tap the phone field and type **9579504871**.
3. Wait about 1 second (do not tap Browse Menu yet).
4. **Expected:** the Name field fills in automatically. No error toast.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Unknown phone — silent, no error

1. Clear the phone field and type **9800000001** (not a known customer).
2. Wait 1 second.
3. **Expected:** Name field stays empty. No toast, no error message.

Result: □ PASS □ FAIL — notes: _____

Part B — Checkout loyalty preview (3 steps, ~5 minutes)

What changed: loyalty earn rates and redemption values now come from CRM's API. Numbers will look different for non-Bronze diners — this is a correction, not a regression. Redemption caps from CRM are now enforced.

Step 3 — Earn preview loads from CRM

1. On restaurant **689**, add any items to cart and go to the checkout page.
2. Scroll to the loyalty section ("You will earn X points…" or "Earn rewards…").
3. **Expected:** the section appears. No error, no blank/broken layout.
4. Optional — open browser DevTools → Network tab → confirm a call to the CRM domain ending in `/scan/loyalty-rules/689`. There should be **no** call to `/api/loyalty-settings/689`.

Result: □ PASS □ FAIL — notes: _____

Step 4 — Redemption value is per tier

1. Log in as a **Gold** or **Silver** tier customer on restaurant **689**.
2. Go to checkout with items in cart. Look at the loyalty earn section ("You will earn X points — Worth ₹Y").
3. **Expected:** the "Worth ₹Y" figure is higher than it was before this change. A Gold diner should see roughly ₹3 per point, not ₹1 per point. The exact number depends on the cart value and CRM's current config.

> This is a **correction** — the old number was wrong (showing the flat rate for all tiers). The new number is the correct per-tier rate from CRM.

Result: □ PASS □ FAIL — notes: _____

Step 5 — Use Points button respects CRM cap

1. Log in as a customer with points on restaurant **689**.
2. Go to checkout and click **Use Points**.
3. **Expected:** the discount applied is at most ₹110 (restaurant 689's `max_redemption_amount` from CRM). If the customer has enough points to exceed ₹110, the discount still shows ₹110 — the excess points are not applied.
4. Also confirm: if the customer does not have enough points to meet the minimum threshold (`min_redemption_points`), the Use button does nothing.

Result: □ PASS □ FAIL — notes: _____

Part C — Checkout phone field no longer triggers name auto-fill (1 step, ~2 minutes)

What changed: the checkout page used to silently look up a diner's points and tier when they typed their phone in the order form. That lookup is removed. Name still comes from the landing page as before.

Step 6 — Typing phone on checkout does not auto-fill name

1. On restaurant **689**, go to checkout **without** logging in.
2. If a name is already showing in the customer name field (pre-filled from the landing page), clear it manually.
3. Click into the phone field and type or edit a phone number.
4. **Expected:** the name field does **not** auto-fill. No points or tier information appears. No error toast.
5. Also confirm: the points/tier "Use Points" block in the price summary is **not visible** for a non-logged-in diner.

Result: □ PASS □ FAIL — notes: _____

Regression — order placement still works (1 step)

Step 7 — Place an order end to end

1. On restaurant **689**, add items, fill in name and phone, and place an order (any payment method).
2. **Expected:** order completes successfully. Order success page loads. No errors at any step.

Result: □ PASS □ FAIL — notes: _____

Reporting

- All steps match → reply **"Smoke PASS CR-2026-10-03-004"**.
- Anything different → reply **"Smoke FAIL CR-2026-10-03-004 — step N"** with what you saw and a screenshot. Do not try to work around it.

Overall: □ PASS □ FAIL Signed: _____ Date: _____

Smoke Test Brief — CR-2026-10-07-002

MyGenie Customer App · Change: "Old OTP code permanently deleted" · QA status: PASS 9/9 — verified 2026-10-08 (test_reports/iteration_6.json) · Tester: _____ · Date: _____

What this is about

Back in September the app's SMS-OTP login path was switched off because CRM's SMS service was never going live. Rather than delete the code then, we **commented it out** and tagged every piece with an `OTP-DEFERRED` marker — "restore when live".

On 8 Oct CRM confirmed in writing that OTP will **never** be implemented. The "restore when live" condition is void, so this change removes the dead code for good.

What was wrong

Nothing was broken for the diner. The problem was hygiene: ~160 lines of commented-out code across 6 files (4 frontend, 1 admin, 1 backend), dead admin toggles for OTP settings, and two server routes (`/api/auth/send-otp` , `/api/auth/reset-password`) that existed only as comments. Dead code like this misleads future work and was blocking CRM from closing their CR-084.

What the change does

All 31 `OTP-DEFERRED` markers and the code behind them are **deleted** — not commented, gone. Four OTP helper functions removed from the CRM service layer, the OTP helpers and routes removed from the server, and the hidden "Skip OTP" / "OTP Required" admin sections removed.

No live code was touched. The diner-facing flow (phone → name → Browse Menu → order) and the admin panel are byte-for-byte the same behaviour as before.

> **What must NOT have changed:** landing page sign-in, menu browsing, ordering, Profile tabs, and every admin page. If anything looks different from yesterday, that is a FAIL.

Before you start

You need	Notes
Restaurant **478**	Standard test restaurant
Test phone **9579504871**	Known customer
Admin login	Phone **+919579504871** / password in `memory/test_credentials.md`
A browser	A fresh tab is fine

The test — 4 steps (about 6 minutes)

Step 1 — Diner sign-in still works

1. Open the restaurant 478 home page.
2. Type phone **9579504871**, wait 1 second for the name to auto-fill.
3. Tap **Browse Menu**.
4. **Expected:** you land on the menu page. No error toast, no blank screen, no password/OTP screen in between.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Add to cart and reach Review Order

1. Add any one item to the cart.
2. Tap the cart and proceed to **Review Order**.
3. **Expected:** Review Order page renders with your item and totals. No errors.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Admin panel unchanged, OTP section gone

1. Open `/login` and sign in as admin.
2. From the admin menu, go to **Visibility** (do not type the URL — use the menu, a hard reload loses the admin session).
3. **Expected:** you see the **Landing Page**, **Menu Page** and **Review Order Page** sections as usual.
4. **Expected:** there is **no** section titled "Skip OTP / Password Setup" and **no** "Auth" sub-tab with "OTP Required" toggles anywhere on the page.
5. Click through **Settings**, **Branding** and **Banners** — each should load normally.

Result: □ PASS □ FAIL — notes: _____

Step 4 — Old server routes are gone (technical check, 1 minute)

Open a new tab and visit each URL below (replace `<app>` with the app domain):

- `https://<app>/api/auth/send-otp`
- `https://<app>/api/auth/reset-password`

Expected: both return **404 / "Not Found"** (a 405 "Method Not Allowed" is also acceptable — it means the route exists for a different method; for these two it must be 404).

Result: □ PASS □ FAIL □ skipped

Reporting

- All steps match → reply **"Smoke PASS CR-2026-10-07-002"**. This also unblocks sending `CRM_CONFIRMATION_NOTE.md` to CRM to close their CR-084.
- Anything different → reply **"Smoke FAIL CR-2026-10-07-002 — step N"** with what you saw and a screenshot. Do not try to work around it.

Overall: □ PASS □ FAIL Signed: _____ Date: _____

Smoke Test Brief — CR-2026-10-03-001

MyGenie Customer App · Change: "Old customer API code removed from the backend" · QA status: PASS — verified 2026-10-09 (test_reports/iteration_8.json, 28/28 + 61/61 regression) · Tester: _____ · Date: _____

What this is about

Before the CRM existed, our own backend handled diner sign-in, passwords, and the Profile page's orders/points/wallet. The CRM took all of that over months ago, but the old backend code was never removed. It was still there — nine endpoints, about 380 lines — reaching into database tables that now belong to the CRM, with nothing in the app calling it.

What the change does

That old code is **deleted**. Nothing a diner or an admin does today used it, so **nothing should look or behave differently**. The one incidental fix: admin login now checks only the admin table (previously it looked in the customer table first, which could have handed an admin the wrong kind of token).

> **What must NOT have changed:** diner sign-in, menu, cart, ordering, Profile tabs, admin login, every admin page. If anything differs from yesterday, that is a FAIL.

Before you start

You need	Notes
Restaurant **478**	Standard test restaurant
Test phone **9579504871**	Known customer
Admin login	Credentials in `memory/test_credentials.md`
A browser	A fresh tab is fine

The test — 3 steps (about 6 minutes)

Step 1 — Admin login and pages

1. Open `/login` and sign in as admin.
2. **Expected:** you land in the admin panel. No error.
3. From the admin menu (not by typing URLs), open **Visibility**, then **Settings**, then **Branding**. Each should load with its usual content.
4. In **Settings**, change one harmless thing (e.g. toggle a popup off and back on) and **Save**. **Expected:** success toast, no error.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Diner: sign-in → menu → cart → Review Order

1. Open the restaurant 478 home page.
2. Type **9579504871**, wait a second for the name to auto-fill, tap **Browse Menu**.
3. **Expected:** menu page, no error toast, no password/OTP screen.
4. Add one item, open the cart, go to **Review Order**.
5. **Expected:** page renders with your item and totals.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Profile tabs

1. From the menu, open **Profile** (hamburger menu).
2. Tap **Orders**, then **Points**. If the restaurant has Wallet enabled, tap **Wallet** too.
3. **Expected:** each tab shows data or an empty state — never a red error or a blank screen.

Result: □ PASS □ FAIL — notes: _____

Smoke Test Brief — CR-2026-10-09-003

MyGenie Customer App · Change: "Loyalty points redemption cap now calculated server-side by CRM" · QA status: PASS (iteration_12.json) · Tester: _____ · Date: _____

What this is about

When a diner reaches the checkout page, the app shows how many loyalty points they can redeem on that order. Previously the app calculated this cap itself using several fields from the loyalty config — but the calculation was approximate and tier-blind. Now the app asks CRM directly, gets an exact server-calculated answer, and shows it to the diner.

What was wrong

The checkout page calculated the max redeemable points client-side using three separate cap values from the loyalty config, applied independently. A Gold diner on restaurant 689 was being shown the wrong cap — the calculation ignored per-tier rates and could allow more or less redemption than CRM would actually honour.

What the change does

When a logged-in diner opens the checkout page, the app calls CRM's `/scan/max-redeemable` endpoint with the cart total. CRM returns the exact number of points the diner can redeem (`max_points_redeemable`) and the exact ₹ ceiling (`max_discount_value`), accounting for their tier, all caps, and the order amount together.

The diner now sees: **"Use up to 36 pts (₹108 off)"** instead of the old **"2000 points (Worth ₹6000)"**. The Use button applies exactly what CRM authorised — no more, no less.

The earn preview ("You will earn X points on this order") also now shows CRM's server-calculated figure.

> **What must NOT have changed:** Name auto-fill on landing, Browse Menu flow, adding items to cart, order placement, all other price breakdown rows, GST calculation.

Before you start

You need	Notes
Restaurant **689** (Kunafa Mahal)	Loyalty is active here
Phone **9035133228**	Known customer — Gold tier, 2,000 points
A browser	Fresh tab recommended

The test — 5 steps (~10 minutes)

Step 1 — Land and auto-fill

1. Open the restaurant 689 home page.
2. Type **9035133228** in the phone field and wait 1 second.
3. **Expected:** name field fills with "saurav". "Welcome back, saurav!" hint appears.
4. Tap **Browse Menu**. You should land on the menu page.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Add an item and reach checkout

1. On the menu, add any available item to the cart (e.g. "st edc" ₹10, or any non-sold-out item).
2. Tap the cart / View Order button.
3. **Expected:** the Review Order (checkout) page loads without error. You see the price breakdown card.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Loyalty row shows CRM cap

1. In the Price Breakdown section, find the loyalty points row (🎁 icon).
2. **Expected:** the row shows text in the form **"Use up to N pts (₹X off)"** — a specific cap, not "2000 points".
3. Below that, "2,000 pts available" subtext.
4. The **Use** button is either enabled (order above minimum threshold) or disabled with a hint like "Add ₹X more to redeem" (order below minimum).

> This is the key change. The old UI showed "2000 points (Worth ₹6000)" — the total balance with no cap. The new UI shows the CRM-approved redeemable amount for this specific order.

Result: □ PASS □ FAIL — notes: _____

Step 4 — Use and Remove

(Only if Use button is enabled in Step 3)

1. Tap **Use**.
2. **Expected:** the row changes to "Using N points (−₹X)". The Grand Total decreases by ₹X. A **Remove** button appears.
3. Tap **Remove**.
4. **Expected:** the discount clears. Grand Total returns to original.

Result: □ PASS □ FAIL □ skipped (Use was disabled) — notes: _____

Step 5 — Earn preview

1. Scroll below the price breakdown card.
2. Look for the "You will earn X points" section.
3. **Expected:** the section appears showing a points earn figure and "Worth ₹Y". The numbers come from CRM and may differ from what the app showed previously.

Result: □ PASS □ FAIL — notes: _____

Reporting

Smoke Test Brief — CR-2026-10-09-002

MyGenie Customer App · Change: "Coupon Apply button now validates against CRM and shows discount before order" · QA status: PASS (iteration_15.json) · Tester: _____ · Date: _____

What this is about

When a diner reaches the checkout page, there is a coupon code input box. Previously the Apply button did nothing — it was a silent no-op. The code got passed to POS in the order but with no discount applied in the UI and no feedback to the diner.

What was wrong

The Apply button had no code wired to it. The diner typed a code, tapped Apply, and nothing happened. The Grand Total did not change. The diner had no way to know if the coupon worked.

What the change does

The Apply button now calls CRM to validate the coupon code before the order is placed. If the code is valid, the discount appears in the price breakdown immediately — the Grand Total drops, taxes recalculate, and the diner sees exactly what they will pay. The discount also flows correctly to POS in the order payload.

If the code is invalid or expired, an error message appears below the input. The Apply button disables on empty input and when the diner is not signed in.

> **What must NOT have changed:** name auto-fill on the landing page, Browse Menu, loyalty points (Use / Remove), order placement, all other price rows.

Before you start

You need	Notes
Restaurant **689** (Kunafa Mahal)	Coupon feature is active here
Phone **9035133228**	Known customer — Gold tier
Coupon code **SEED_EDGE_STACKABLE**	A valid coupon — small discount, can be combined with loyalty points
A browser	Fresh tab

The test — 4 steps (~8 minutes)

Step 1 — Land and add item

1. Open the restaurant 689 home page.

2. Type **9035133228**, wait for name "saurav" to auto-fill, tap **Browse Menu**.
3. Add any available item to the cart (e.g. "st edc" ₹10).
4. Tap the cart and proceed to the checkout / Review Order page.
5. **Expected:** checkout page loads. Price breakdown shows the item total and a coupon code input row with an **Apply** button.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Apply a valid coupon

1. In the coupon code input, type **SEED_EDGE_STACKABLE**.
2. Tap **Apply**.
3. **Expected:**
4. The input row is replaced by: **"🏷️ SEED_EDGE_STACKABLE — ₹X off"** with a **Remove** button.
5. A toast notification confirms the coupon was applied.
6. The Grand Total drops by ₹X.
7. The CGST and SGST rows show slightly lower values (tax recalculated on the discounted amount).

> The exact discount amount depends on CRM's current config for this coupon. The key check is that the total drops and taxes are lower.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Remove the coupon

1. Tap **Remove** next to the applied coupon.
2. **Expected:**
3. The coupon input row reappears (empty, ready to type).
4. Grand Total returns to the original amount.
5. Taxes return to their original values.

Result: □ PASS □ FAIL — notes: _____

Step 4 — Invalid coupon

1. Type **BADCODE999** in the input and tap **Apply**.
2. **Expected:** Error text appears below the input: "Invalid coupon code: BADCODE999". The Apply button stays enabled (so the diner can correct the code). No change to the Grand Total.

Result: □ PASS □ FAIL — notes: _____

Optional — Place an order with coupon applied (2 minutes)

1. Apply **SEED_EDGE_STACKABLE** again.
2. Place the order.
3. **Expected:** Order success page loads. The Bill Summary on the success page shows the discounted subtotal and correct taxes.

Result: □ PASS □ FAIL □ skipped

Smoke Test Brief — CR-2026-10-07-001

MyGenie Customer App · Change: "Feedback form now open to all diners — no sign-in required" · QA status: PASS (iteration_16.json) · Tester: _____ · Date: _____

What this is about

The feedback page previously showed a "Sign in to leave feedback" card to any diner who hadn't logged in. They had no way to submit feedback without going back to the home page, signing in, and returning. Most diners never did.

What was wrong

The Submit Feedback form was hidden behind a sign-in gate. Diners who arrived on the feedback page without a session (common on low-friction scan-and-order flows) saw only a "Sign in" button and gave up.

What the change does

The sign-in card is gone. Every diner — logged in or not — now sees the feedback form. There is a new optional phone number field at the top for non-logged-in diners. Entering your phone links the feedback to your loyalty profile; leaving it blank submits anonymously. Either way, the feedback goes through.

> **What must NOT have changed:** logged-in diners still see the same form (without the phone field), rating + message fields work identically, thank-you screen is the same.

Before you start

You need	Notes
Restaurant **689**	Feedback enabled here
A browser	Fresh tab, not logged in

The test — 3 steps (~5 minutes)

Step 1 — No sign-in card

1. Open `https://mygenie-diners.preview.emergentagent.com/689/feedback` directly in a fresh browser tab (do not log in first).
2. **Expected:** The feedback form appears with a **"Your phone (optional)"** field at the top and the usual star rating and message fields below. There is **no** "Sign in" button and **no** "Feedback is available to signed-in diners" message.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Submit without phone (anonymous)

1. Leave the phone field blank.
2. Select any star rating (e.g. 4 stars).
3. Type a message (e.g. "Great food!").
4. Tap **Submit Feedback**.
5. **Expected:** Thank You screen appears. "Your feedback has been submitted."

Result: □ PASS □ FAIL — notes: _____

Step 3 — Logged-in diner sees no phone field

1. Go to the home page `/689`, type phone **9035133228**, wait for name to auto-fill, tap Browse Menu.
2. Navigate to `/689/feedback`.
3. **Expected:** Feedback form appears **without** the phone number field. Only stars and message. Submit works as before.

Result: □ PASS □ FAIL — notes: _____

Smoke Test Brief — CR-2026-09-15-004

MyGenie Customer App · Change: "Admin login now goes through POS directly — CRM database no longer read" · QA status: PASS (iteration_17.json) · Tester: _____ · Date: _____

What this is about

When a restaurant admin logs into the app, the app previously looked up their account in CRM's database to verify their password and fetch their restaurant details. This was a boundary violation — your app was reading a database table it does not own. This CR removes that dependency entirely.

What was wrong

Admin login read directly from CRM's `users` table — twice. Once to verify the password at login, and again on every admin API request to get the restaurant ID. Any change CRM made to that table could silently break admin login with no warning.

What the change does

Admin login now calls POS directly (the same system CRM itself uses). POS verifies the credentials, returns a session token, and your app fetches the admin's profile from POS to get the restaurant ID and other details. All of this is packed into the login token — subsequent requests read from the token only. CRM's database is never touched.

Deploy note: Any admin logged in before this change is deployed will see a "session expired" message on their first page load. They log in once and everything works normally.

> **What must NOT have changed:** admin login form, admin dashboard, config save, table configuration fetch — all work identically.

Before you start

You need	Notes
Admin email	`owner@kunafamahal.com`
Admin password	`Qplazm@10`
Restaurant	689 (Kunafa Mahal)
Browser	Fresh tab

The test — 3 steps (~5 minutes)

Step 1 — Admin login works

1. Open the app and navigate to the admin login page (e.g. `/689` then tap Login, or go to `/admin/login` directly).
2. Enter `owner@kunafamahal.com` and `Qplazm@10`.
3. Tap **Sign in**.
4. **Expected:** You land on the admin dashboard. Restaurant name "Kunafa Mahal" is visible. No errors.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Admin can save settings

1. While logged in, go to any settings section (e.g. Branding or Visibility).
2. Make a small change (e.g. toggle a visibility flag on and off).
3. Tap **Save**.
4. **Expected:** Save succeeds. No error message. Setting reflects the change.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Wrong password is rejected

1. Log out and try to log in again with the wrong password (e.g. `wrongpassword`).
2. **Expected:** Login fails with an error message. You are not taken to the dashboard.

Result: □ PASS □ FAIL — notes: _____

Reporting

- All steps match → reply **"Smoke PASS CR-2026-09-15-004"**.
- Anything different → reply **"Smoke FAIL CR-2026-09-15-004 — step N"** with what you saw and a screenshot.

Smoke Test Brief — CR-2026-10-11-001

MyGenie Customer App · Change: "Coupon code no longer sent to POS unless CRM has validated it" · QA status: PASS (iteration_18.json) · Tester: _____ · Date: _____

What this is about

When a diner reaches the checkout page and types a coupon code, the app asks CRM to validate it. This test checks that if CRM does not recognise the code — or the coupon only exists inside POS but not in CRM — the coupon is cleanly dropped and does not silently reach POS behind the diner's back.

What was wrong

When a diner typed a coupon code and tapped Apply, the app sent it to CRM to validate. If CRM said "I don't know this code", the app correctly showed an error and set the discount to ₹0. However it was still sending the raw coupon code to POS in the order payload. POS, seeing a code it recognised, applied its own discount — say ₹197 off. POS's final total (₹109) and the amount our app sent as `order_amount` (₹315, calculated without that discount) were now completely different numbers. The diner was charged the wrong amount by Razorpay, POS's records were wrong, and loyalty earn points were based on the wrong total.

What the change does

The app now only sends a coupon code to POS if CRM has already confirmed it is valid. If CRM rejects the code for any reason, the code is silently dropped from the order payload — POS receives an empty coupon field and applies no discount of its own. The error message shown to the diner was also updated from the generic "Could not validate coupon. Please try again." to the clearer **"Coupon not recognized for online orders."**

> **What must NOT have changed:** valid CRM coupons still work exactly as before — the discount shows in the price breakdown and flows to POS correctly. Loyalty points, name auto-fill, Browse Menu, and all other price rows are untouched.

Before you start

You need	Notes
Restaurant **689** (Kunafa Mahal)	Coupon feature is active here
A signed-in customer account	Phone **+919579504871** — use at landing page
An item in the cart	Any available menu item
Coupon code **TESTINVALIDXYZ**	A code that does not exist in CRM

The test — 3 steps (~6 minutes)

Step 1 — Land and add item

1. Open the restaurant 689 home page.
2. Type **+919579504871** at the landing page and tap **Browse Menu**.
3. Add any available item to the cart (e.g. ₹10 item).
4. Tap the cart and proceed to the **Review Order / checkout page**.
5. **Expected:** checkout page loads with a coupon code input row and an **Apply** button visible in the price section.

Result: □ PASS □ FAIL — notes: _____

Step 2 — Apply an unrecognised coupon code

1. In the coupon input, type **TESTINVALIDXYZ**.
2. Tap **Apply**.
3. **Expected:**
4. A toast notification appears saying exactly: **"Coupon not recognized for online orders."**
5. The coupon is **not** shown as applied in the price breakdown.
6. The Grand Total does **not** change.
7. The Apply button becomes available again after the error.

> This was the bug scenario. The old message said "Could not validate coupon. Please try again." — if you see the old wording, that is a FAIL.

Result: □ PASS □ FAIL — notes: _____

Step 3 — Place the order and check the amount

1. With **no coupon applied**, place the order (tap Place Order / Pay).
2. **Expected:**
3. The order success page loads.
4. The total shown on the success page matches what was displayed on the Review Order page before placing.
5. The amount is a realistic non-zero number (e.g. ₹10 or more — **not ₹0, not ₹6**).

> This confirms the payload mismatch is gone. The old bug could result in `order_amount = ₹0` or ₹6 being sent to POS while the screen showed a different number.

Result: □ PASS □ FAIL — notes: _____
